

## Bar B01P User Guide

### User Guide

#### ■ Instructions

##### • Check equipment before use

1. Check if the 6.35mm plug of the guitar cable is fully inserted into the tail of the guitar before use. Whether it is intact and whether each device is working properly.

##### • Use

1. Turn the volume knob of each device to the lowest level during use to avoid overload or loud noise when plugging and unplugging the cable plug. After the cable plug is plugged in, adjust the device volume knob to a suitable position.
2. When in use, the B01P pickup sound control knob can be adjusted. The sound control knob has a volume control knob and a bass control knob. The volume knob can adjust the total volume. The bass control knob can attenuate the high frequency of the sound to highlight the effect of more bass. The B01P pickup can be used for guitar speakers, mixers, sound cards or effects.
3. When finished, turn down the volume of all devices to the lowest level, and then turn off the power of the device. After the power of other devices is turned off, unplug the audio cable. Try to avoid overloading or loud noise when using the device.
4. When not using the B01P pickup, in order to save the battery power of the pickup, you must unplug the guitar's tail plug to disconnect the power.
5. When the B01P pickup does not have enough power to maintain work, you must continue to use it after replacing it with a new 9V battery. The replaceable 9V battery models include disposable carbon 6F22 batteries, alkaline 6LR61 batteries, and rechargeable 9V batteries. It is recommended High-quality 9V battery.
6. Refer to Figure 1 for how to use it.
