

Forara F01P/F01E User Guide

User Guide

■ Instructions

• Check equipment before use

Check if the 6.35mm plug of the guitar cable is fully inserted into the tail of the guitar before use. Whether it is intact and whether each device is working properly.

• Use

- 1.The volume knob of the device must be adjusted to the lowest level before plugging or unplugging all kinds of working equipment, so as to avoid overload or loud noise when plugging and unplugging the plug of the cable. Turn the volume knob to the appropriate position.
- 2.The signal produced by the Forara pickup itself is slightly small. It is best to use it after connecting a dedicated amplifier pre-stage or a dedicated amplifier device. The dedicated device can be a sound card with a guitar input interface, guitar effects, guitar sound, mixer, or Various audio equipment with guitar interface.
- 3.Forara electromagnetic pickup comes with a small metric 2.5mm hexagonal wrench, which is used to adjust the position of the pickup's magnetic pole screw above the surface of the pickup. The closer the magnetic pole is to a certain string, the greater the volume of the string and the farther away it is from a certain string. , The lower the volume of the string, you can fine-tune the volume of the string by adjusting the high and low of a certain string. The Forara electromagnetic pickup has been adjusted according to the standard guitar at the factory. The volume of each string is approximately equal, which can meet the absolute requirements. Most guitar users use it, and users generally do not need to adjust the pickup pole screw.
- 4.When finished, turn down the volume of all devices to the lowest level, and then turn off the power of the device. After the power of other devices is turned off, unplug the audio cable. Try to avoid overloading or loud noise when using the device.
- 5.Refer to Figure 1 for how to use it.
